前 言

PREFACE

前 言

「生產力」觀念係由 18 世紀經濟學者奎內（F. Quesnay）所提出，在二次大戰後才普遍受到重視。當年在美國推動下的馬歇爾計劃，實際上就是如何提高生產力的計劃，透過此一計劃使得西歐在短短數年間，便從戰爭的廢墟中重建起來可見生產力提高的重要性。

「生產力」在經濟學的概念為產出與投入的比率；而生產力的提高，即意謂以相同的投入生產較多的產出，或同樣的產出使用較少的投入。不過，提高生產力的真諦，並非完全在於減少投入，相反的，應該是在於增加產出，或提高產出之品質，以創造就業機會、增進社會福利及提升全民福祉。

我國自民國 44 年推行生產力運動以來，由於政府與民間的共同努力，雖在地狹人稠，資源貧乏的限制下，仍能積極促進企業生產力之提高，使得商品生產成本降低，就業市場活絡，出口能力增強，工商企業乃蓬勃發展，創造了舉世欽羨的經濟奇蹟，而躋身為新興工業化國家之林。

展望未來對外貿易仍為我國經濟發展之命脈，而面臨國際間日益劇烈的挑戰，充分且有效地運用各項有限資源，乃為致勝關鍵之所繫，換言之，惟有不斷加速生產力的提升，方能於現今國際競賽中脫穎而出。

生產力的重要性已廣為大眾所接納，惟生產力有否提升，則必需經由生產力統計指標的測定方能確認，而這正是為一般人所忽略。本總處有鑑於此，自民國 61 年 7 月起採用「工業生產指數除以受僱者投入工時指數」的方法，按月編製製造業及水電燃氣業的勞動生產力指數，以供政府制訂勞工、產業政策、學術界從事學術研究、產業界從事決策運用之參考，然因限於產出資料的取得，故涵蓋業別範圍未盡周延，致陳示全國總勞動生產力及產業間勞動生產力之差異性，則付之闕如，為改進此一缺憾，本總處特從 75 年起採用國內生產毛額（GDP）與就業者投入工時配合的觀念，編製全國各產業之產值勞動生產力，其較原方法改進之處如下：

1. 行業範圍較為周延，亦即涵蓋全國 16 大行業。
2. 投入範圍擴大至全體就業者，而不僅止於受僱者。

3. 由於附加價值率的變動，使得產出的衡量較為正確。

其目的在於正確反應我國勞動生產力之變動趨勢，指出未來資源流向及利用方式，惟受到時間與人力所限，報告中若有疏漏之處，尚期各界多予指正，以使本報告更臻完美。

Preface

The concept of “productivity” was first put forth by F. Quesnay, an 18th century economist, but it had not received widespread attention until the World War II ended. In fact, the Marshall Plan launched by the United States at that time was a program designed to raise productivity. The plan which helped rebuild the Western Europe on the war-torn ruins in just a few years has demonstrated the importance of raising productivity.

Economically, “productivity” is a ration between output and input. Producing can do raising productivity more output without increasing input or by cutting input without reducing output. In reality, raising productivity should not lie in cutting input. Instead, it should rest on increasing output or upgrading quality in order to create employment opportunity and enhance social welfare and well-being of the people.

Since the first campaign to enhance productivity in this country was launched in 1955. Due to the government and the private sector have closely worked together, as a result, despite heavy population living on a piece of very limited land and despite scarcity of resources, the program has made a great contribution to improvement of productivity, lowering production costs, activating employment market, sharpening this country’s competitive edge in the export market, and leading to quick industrial and commercial development. This program, among other things, has created an economic miracle renowned in the world and sent this country to become one of the newly industrialized nations.

The prospect for the future is that external trade will remain to be a backbone to this country’s economic development. As a challenge facing this country arising from competition in international market is getting stronger, how to maximize utilization of resources is a key point for the future efforts to score victory in the contest. In other words, the only way to lead an international race in the modern times is to constantly raise productivity without interruption.

The importance of productivity has already been widely recognized. To determine whether the productivity is lifted or not should rely on a statistical indicator to measure it, but the measurement and the indicator have very often been neglected. In view of this point, the Directorate-general of Budget,

Accounting and Statistics (DGBAS) began to prepare labor productivity indexes for Manufacturing and Electricity, gas & water industries in July of 1972. The productivity was calculated by “dividing input of total work hours into industrial production index.” The productivity indexes have been used as a reference by government in its manipulating labor and industrial policies, by academic circles in their research and study, and by businessmen in their management. As the availability of output data is limited, the productivity indexes did not cover all industries, resulting in lack of labor productivity indicators for the entire economy and for all individual industries. Comparison of labor productivity between industries was impossible. To correct the shortcoming, the DGBAS adopted a new concept to calculate the labor productivity statistics in 1986. Specifically, gross domestic product (GDP), instead of industrial production index, is compared with input of work hours. The new method has three advantages over the old one; they are as follows:

1. Scope is expanded. Now all of the 16 major industries in this country are included.
2. Coverage of input is broadened to include the entire employment, instead of just employed workers.
3. With the rate of change in value-added increment being available, output can be more correctly measured.

The change in calculation method is primarily designed to reflect the accurate trend of labor productivity over a series of time in order to indicate flow and utilization of resources and to project the trend to go in the future. However, due to limitation in time and manpower available, there may be mistakes and omissions overseen and thus contained in this report. We would appreciate your correction and advice in a hope to make the report become better in the future.

Indexes of Labor Productivity and Unit Labor Costs of Manufacturing

貳、提要分析

II. SUMMARY ANALYSIS

提 要 分 析

對國內產業發展而言，提升勞動生產力不僅可促進經濟持續成長，並有助於穩定物價、降低生產成本，以及提升薪資水準。鑒於產業在經營及生產活動過程中，最主要之投入要素為勞動與資本二項，因此研究國內產業之勞動生產力趨勢，可了解產出與勞動投入之間的消長關係，亦有助釐析勞動生產力受資本密集度與技術進步率之影響。

有關產業勞動生產力之研究，係衡量每單位勞動投入所獲得之產出，通常以（總產出／總勞動投入）表示，可作為各產業勞動投入使用效率，以及潛在經濟生產量之指標，其中總產出以「實質國內生產毛額」衡量，即以產值概念來衡量，總勞動投入則以「就業投入總工時」衡量。

此外，研究產業之單位產出勞動成本，係衡量每單位生產所付出之勞動成本，通常以（總勞動成本／總產出）表示，可視為產業競爭力之指標，其中總勞動成本以「就業者總薪資」衡量，總產出亦以「實質國內生產毛額」衡量。

為觀察國內產業之勞動生產力與單位產出勞動成本變動趨勢，茲根據前述說明，將二者之涵義以公式表示如下：

- (1) 產值勞動生產力（以下簡稱勞動生產力）＝實質國內生產毛額／
就業投入總工時
- (2) 單位產出勞動成本＝就業者總薪資／實質國內生產毛額
由（1）與（2）之關係導出
- (3) 單位產出勞動成本＝（就業者總薪資／就業投入總工時）／
（實質國內生產毛額／就業投入總工時）
＝平均每工時薪資／勞動生產力

對產業經營而言，單位產出勞動成本變動情形係觀察產業競爭力之重要指標，故由（3）即可顯示，欲降低勞動成本以提升產業競爭力，主要須藉由提高勞動生產力以達成目標。

全體產業

臺灣是以出口為導向的淺碟型經濟，易受外需變動影響。101年國內經濟活動，外受歐洲債務危機延燒及全球景氣走緩波及，內因油電雙漲及證所稅等議題影響，致景氣對策信號連續10個月出現代表衰退的藍燈，後因出口及工業生產好轉，逐漸脫離低迷，惟復甦力道仍弱，致全年經濟成長率僅溫和成長1.26%，仍遠低於上(100)年之表現。

101 年國內全體產業實質生產毛額(本報告中之 GDP 不含國外要素所得淨額、住宅服務、政府服務及誤差項，計算方式詳後附「編製方法說明」)較上年成長 0.82%，低於就業投入總工時之增幅 1.28%，因全年總產出成長幅度低於勞動投入，致勞動生產力較上年下降 0.46%。

單位產出勞動成本方面，因平均每工時薪資較上年上升 0.36%，勞動生產力下降 0.46%，致全體產業單位產出勞動成本較上年上升 0.82%。

(一)農林漁牧業

受到國際原油及穀物價格居高不下影響，農林漁牧業面臨經營成本上升壓力，致 101 年全年農林漁牧業實質 GDP 負成長 5.82%，而就業投入總工時減少 0.36%，致勞動生產力較上年下降 5.47%，單位產出勞動成本上升 6.65%。

(二)工業

101 年隨全球經濟走緩，國際貿易成長減弱，擠壓我整體出口成長空間，但因平板、超薄電腦與雲端運算等高科技與消費性電子產品不斷推陳出新、ECFA 早期收穫項目效益持續發酵，均有助於推升出口。101 年全年工業部門實質 GDP 成長 0.94%，高於就業投入總工時增幅 0.52%，致勞動生產力較上年上升 0.42%。若以單位產出勞動成本觀之，受全年平均每工時薪資增幅 1.10%，高於勞動生產力增幅 0.42%的影響，致較上年上升 0.69%。

就各大行業勞動生產力觀察，天然氣價格受上年進口價格上漲，但售價因凍漲政策影響 GDP 表現，由於比較基期較低，致 101 年礦業及土石採取業實質 GDP 較上年成長 10.43%，高於就業投入總工時增幅 2.52%，致勞動生產力上升 7.72%最為顯著；本年雖全球經濟復原力道不強勁，但因製造業之電子零組件業受惠於智慧手機與平板電腦需求暢旺與雲端運算等 ICT 產品日新月異，帶動整體製造業實質 GDP 成長 0.98%，高於就業投入總工時增幅 0.16%，致勞動生產力上升 0.81%；電力及燃氣供應業因售電量微減，實質 GDP 僅成長 0.66%，低於就業投入總工時增幅 3.58%，致勞動生產力下降 2.82%；用水供應及污染整治業實質 GDP 成長 1.17%，低於就業投入總工時增幅 4.20%，致勞動生產力亦降 2.91%；營造業實質 GDP 負成長 0.95%，而就業投入總工時增加 1.37%，致勞動生產力亦較上年下降 2.30%。

就單位產出勞動成本觀察，除營造業因勞動生產力減幅高於每工時薪資，以及製造業因勞動生產力增幅低於每工時薪資，致單位產出勞動成本分別上升 2.29%及 0.90%，其餘各業均呈負成長，其中礦業及土石採取業因勞動生產力

(8)

上升 7.72%，而每工時薪資減少 3.46%，致單位產出勞動成本下降 10.37% 最顯著，電力及燃氣供應業與用水供應及污染整治業，因每工時薪資減幅大於勞動生產力，致單位產出勞動成本分別下降 3.17% 及 2.01%。

(三)服務業

101 年受惠於來台旅客人數成長達 2 成及兩岸開放政策的推行，服務業部門全年實質 GDP 較上年增加 0.95%，惟低於就業投入總工時增幅 2.03%，致勞動生產力下降 1.06%。另因每工時薪資年減 0.27%，低於勞動生產力之減幅 1.06%，致單位產出勞動成本較上年上升 0.80%。

就各大行業觀察，運輸及倉儲業、藝術、娛樂及休閒服務業與其他服務業因實質 GDP 成長高於就業投入總工時增幅，致勞動生產力年增率呈現上升，其餘各業則均呈下降，其中不動產業與專業、科學及技術服務業因實質 GDP 為負成長，而就業投入總工時均呈增勢，致勞動生產力分別下降 3.05% 及 2.64%，住宿及餐飲業因就業投入總工時增幅達 4.29%，高於實質 GDP 之成長，致勞動生產力亦下降 2.37%。

若由單位產出勞動成本觀察，專業、科學及技術服務業因受平均每工時薪資上升 1.64% 及勞動生產力下降達 2.64% 之雙重影響，致單位產出勞動成本較上年上升 4.40% 最為顯著；藝術、娛樂及休閒服務業因平均每工時薪資上升達 4.77%，明顯高於勞動生產力之增幅 0.67%，致單位產出勞動成本亦較上年上升 4.08%。而不動產業受每工時薪資下降幅度高於勞動生產力影響，致單位產出勞動成本較上年下降 2.27%，其他服務業則因每工時薪資上升幅度低於勞動生產力，致較上年亦下降 1.51%。

全體產業勞動生產力與單位產出勞動成本

指數基期：民國95年=100

單位：%

| 項目別 | 勞動生產力 (每工時產出) | | 產出 (實質GDP) | | 就業投入 總工時 | | 單位產出 勞動成本 | | 平均每工時 薪資 | |

Summary Analysis

As far as the development of domestic industries are concerned, raising labor productivity can not only promote sustainable economic growth, but also stabilize commodity prices, lower production costs, and raise the level of salary. Research on the labor productivity trend of domestic industries has been made after learning the fact that an industry, in the process of management and production activities, has the two main input factors of labor and capital. This research also contributes to further analysis on the level of capital-intensiveness and the effect of the rate of progress of technological advancement.

As for the research on the labor productivity of industry, it evaluates the output attained from Unit Labor Input, which is usually indicated with "Total Output divided by Total Labor Input." This in turn can serve as an indicator of the efficiency of Labor Input by industry as well as potential economic production. Of it, the total output is evaluated with "real GDP," namely an evaluation based on the concept of output value. As for the Total Labor Input, it is evaluated with total employed hours."

In addition, unit labor cost on research industries is meant to evaluate Labor Cost spent on unit output. It is usually indicated by Total Labor Cost divided by Total Output and can be deemed as an indicator on the competitiveness of such industries. Of them Total Labor Cost is evaluated with Total Employee Earnings, while Total Output is evaluated with real GDP.

In order to observe the changing trend of labor productivity of domestic industries and their unit labor costs, we have indicated the meaning of the two with the following formulae based on the above-mentioned explanation:

$$(1) \text{ labor productivity} = \text{real GDP} / \text{total employed hours}$$

$$(2) \text{ unit labor costs} = \text{Total Employed Earnings} / \text{real GD}$$

From (1) and (2) we can lead to the following:

$$(3) \text{ unit labor costs} = (\text{Total Employed Earnings} / \text{total employed hours}) / (\text{real GDP} / \text{total employed hours}) \\ = \text{average earnings per working hour} / \text{labor productivity}$$

For industrial operations, changes in unit labor costs are an important indicator for observing industrial competitiveness. Therefore, as indicated by formula (3), labor costs can be reduced by improving labor productivity, thereby enhancing industrial competitiveness and achieve the goals.

All Industries

Taiwan is an export-driven economy of shallow dish markets, vulnerable to the effects of changes in external demand. The domestic economic activities in 2012 were affected externally by the impact of the Europe's debt crisis and the global economic slowdown, and internally by the rising electricity and oil prices, and the capital gain tax issues. For ten consecutive months, economic monitoring indicators showed the blue light of recession. Later, as exports and industrial production improved, the economy gradually emerged from the downturn, but the weak recovery achieved a modest annual economic growth rate of 1.26%, still far below the performance of the previous year's (2011).

In 2012, the real GDP of all industries increased by 0.82%, lower than the increase of 1.28% of total employed hours. Due to the total output annual growth rate is lower than the labor input, labor productivity decreased by 0.46% compared to the previous year. (GDP cited in this report does not include income net value for foreign elements, housing services, government services, and errors. As for its method of calculation, please refer to the chapter "Compilation Method" in detail.)

Regarding the unit labor cost, the average earnings per working hour compared to the previous year had increased by 0.36%, and labor productivity declined by 0.46%, causing unit labor costs in all industries to increase by 0.82% compared to the previous year.

Agriculture, Forestry, Fishing, and Animal Husbandry

Subjected to the high international prices of crude oil and grain, agriculture, forestry, fishing, and animal husbandry face the pressure of rising operating costs. As a result, real GDP in the agriculture, forestry, animal husbandry, and fishing declined by 5.82% in 2012, and the total employed hours decreased by 0.36%, causing labor productivity to decrease by 5.47% compared to the previous year, and unit labor costs to increase by 6.65%.

(1) Industry

With the global economic slowdown in 2012, the weakening growth of international trade squeezed out room for total exports to grow. However, as tablets, ultra-thin computers, cloud computing, and other high-tech and consumer electronics products are constantly being innovated, the benefits of the ECFA "early harvest" list continue to help push up exports. Real GDP growth of

industrial sectors throughout the whole of 2012 was 0.94%, which is higher than the increase of 0.52% in total employed hours, causing labor productivity to increase by 0.42% compared to the previous year. In terms of the unit labor cost, the annual average earnings per working hour increased by 1.10%, and the labor productivity increased by 0.42%, resulting in an increase of 0.69% in unit labor costs compared to the previous year.

Regarding observations of labor productivity of major industries, the price of natural gas was subjected to a rise in import prices in the previous year, but the selling price due to a price freeze policy, affected GDP performance, making the base of comparison low. In 2012, real GDP of mining and quarrying industry increased 10.43% over the previous year, higher than the increase of 2.52% in total employed hours, resulting in a significant increase of 7.72% in labor productivity. Although the global economic recovery force is not strong this year, the manufacturing industry of electronic parts and components benefited from the demand for the continual innovation of smartphones, tablets, cloud computing, and the advance of other ICT products. Real GDP of the manufacturing industry increased by 0.98%, higher than the increase of 0.16% in total employed hours, resulting in total increase of 0.81% in labor productivity. Due to the slight decrease in electricity sales, real GDP of the electricity and gas supply industry rose only 0.66%, lower than the increase of 3.58% in total employed hours, resulting in decline of 2.82% in labor productivity. Real GDP growth of water supply and remediation services was 1.17%, lower than the increase of 4.20% in total employed hours, resulting in a drop of 2.91% in labor productivity. Real GDP of construction industry decreased by 0.95%, while total employed hours increased by 1.37%, causing a decrease of 2.30% in labor productivity over the previous year.

Regarding unit labor costs, the construction industry achieved a decrease in labor productivity higher than the decrease in earnings per working hour, and the manufacturing industry achieved an increase in labor productivity lower than the increase in earnings per working hour, causing unit labor costs to increase by 2.29% and 0.90%, respectively. The other industries showed a decline. Labor productivity of mining and quarrying industries was up by 7.72% and the average earnings per working hour decrease by 3.46%, resulting in a significant drop of 10.37% in unit labor costs. For both the electricity and gas supply industry, and water supply and remediation services, the decrease in average earnings per working hour was greater than the decrease in labor productivity, so unit labor costs decreased by 3.17% and 2.01%, respectively.

Services

In the whole of 2012, the service sector benefited from the 20% growth in number of visitors to Taiwan and implementation of open cross-strait policy. The real GDP annual increase of 0.95% over the previous year is lower than the total employed hours increase of 2.03%, so labor productivity declined by 1.06%. In addition, average earnings per working hour declined by 0.27%, which is lower than the labor productivity decrease of 1.06%, unit labor costs increased by 0.80% compared to the previous year.

Regarding observations of major industries, in the transportation and storage industry, arts, entertainment and recreation services, and other services, real GDP growth was higher than the increase in total employed hours, causing the annual growth rate of labor productivity to rise. Other industries showed a decline. Real GDP of real estate industry and professional, scientific and technical services were decline, while total employed hours showed a momentum of growth, causing labor productivity to decrease by 3.05% and 2.64%, respectively. In the accommodation and food services, total employed hours increased by 4.29%, which was higher than the real GDP growth, resulting in labor productivity decrease of 2.37%.

In observations of unit labor costs, the professional, scientific, and technical services were affected by the dual effect of average earnings per working hour that increased by 1.64% and labor productivity that decreased by 2.64%, thus resulting in a significant increase of 4.40% in unit output labor costs compared to the previous year. In the arts, entertainment, and recreation services, the 4.77% rise in average earnings per working hour was significantly higher than the 0.67% increase in labor productivity, resulting in an increase of 4.08% in unit labor costs compared to the previous year. The real estate industry was affected by a decline in average earnings per working hour, which was higher than the decline in labor productivity, causing unit labor costs to decrease by 2.27% compared to the previous year. In other services, the rise in average earnings per working hour was less than the rise in labor productivity, causing unit labor costs to also decrease by 1.51% compared to the previous year.

Labor Productivity and Unit Output Labor Cost of All Industries

Base Period : 2006 = 100

伍、編製方法說明

V. DESCRIPTION OF METHODS
USED IN COMPILATION

編製方法說明

一、理論基礎

生產力的衡量有「平均」與「邊際」兩種方法，惟邊際生產力在統計實務中尚停留在理論階段，故目前所編布的勞動生產力，都是以「總產出」除以「總投入」的平均觀念來編製。

依產值編算之勞動生產力指數，其產出部分係採用國民所得生產帳（NIPA）中之實質國內生產毛額（GDP），而投入部分則採用場所面與家計面兩種調查所得之受僱員工與雇主、自營作業者、無酬家屬工作者之人數、工時等資料，以為編製基礎。其計算公式如下：

$$1. \text{勞動生產力指數} = \frac{\text{實質國內生產毛額指數}}{\text{勞動投入指數(工時} \cdot \text{就業者} \cdot \text{等就業者)}} \times 100$$

（以民國 95 年為基期，並按 95 年固定價格表示）

$$2. \text{勞動生產力} = \frac{\text{實質國內生產毛額}}{\text{勞動投入量(工時} \cdot \text{就業者} \cdot \text{等就業者)}}$$

（按民國 95 年固定價格表示）

二、產出的衡量

衡量生產力必須使用固定價格表示的實質產出才有意義。依產值編製之勞動生產力指數，是以國民所得「生產」帳（NIPA）中的實質國民生產毛額（GNP）為衡量產出的基礎。但由於許多國民生產毛額的重要組成項，因找不到適當的相對投入、或產出與投入成比例變動者，如國外要素所得淨額、住宅服務、政府服務、及誤差項等，均不計入產出衡量中。

（一）國外要素所得淨額：

係本國國民參加國外生產之所得，減外國國民在國內參加生產獲取所得之差額。此項產出在場所面與家計面的人力資源調查中，因找不到相對的勞動投入與之對應，當然必須將其排除於產出之外，以正確反應生產力的變動。

（二）住宅服務：

係住家用的房屋，其出租或自住的租金部分。此項產出也無適當的勞動投入與之配合，自不應包括在產出範圍內。

（三）政府服務：

此項產出係指政府機關各部門（包含國防部門）決算書的人事費用項。此項產出在衡量時，是依政府人員受僱小時的改變以為計算之基礎，且採固定價格表示，故生產力的變動在此情形下，因被固定而失去意義，自以將其排除較為適宜。

(四)誤差項：

1. 「設算銀行服務費」項，係指將金融機構的利息收入減除利息支出之餘額。此因屬各業中間消費，理當在各業產出中扣除，唯在技術上目前尚無適當的扣除方法，故在各行業中並不扣除此項目。
2. 「進口稅」項，係指關稅、商港建設費與進口貨物稅。此因新的國民經濟會計制度修改為單獨列帳，不再併計各產業帳內，目前無適當之方法可併入各行業中，故在各行業中不計入此項。

三、勞動投入的衡量

(一)工時：

就常理言，勞動工時的投入比就業人數投入的變動，更能反應生產力的變動，而此一勞動工時應指工作工時而非有酬工時。由於產出資料係採用國內生產毛額，是以勞動的投入應為就業者的工作工時（即除了受僱員工的延人工時之外，尚包括雇主、自營作業者、及無酬家屬工作者的延人工時），較能符合生產力分析之要求。

本總處現有由住戶面調查（即人力資源調查）所產生之就業者人數資料，此為研究就業人數結構的常用指標，但考慮工時反應生產力變動之準確性，則應用本總處由場所面調查（即受僱員工薪資調查）所產生之受僱員工工時資料，較能反應生產力之變動，因此，本統計目前衡量投入面時，係採用人力資源統計中的就業人數（即雇主、自營作業者、受僱者、及無酬家屬工作者等），配以受僱員工統計中之工時，並經下列公式調整後應用。

1.調整前非農業勞動力雇主（受僱者、無酬家屬工作者、自營作業者）的工時 ×

$$\frac{\text{受僱員工的工時}}{\text{勞動力受僱者的工時}} = \text{調整後非農業雇主（受僱者、無酬家屬工作者、自營作業者）的工時。}$$

2.調整前每週農業雇主（受僱者、無酬家屬工作者、自營作業者）的工時 ÷ 7 × 當月日數 = 調整後每月農業雇主（受僱者、無酬家屬工作者、自營作業者）的工時。

(二)就業者：

有鑑於部分國家，至今仍沿用較簡單的「每就業者產出」來衡量勞動生產力的變動，故本報告亦將「每就業者產出」（就業者計包括有家計面之雇主、自營作業者、及無酬家屬工作者，與受僱者）列出，以供應用及便於國際比較。

(三)等就業者：

為將不同工時的勞動投入，化為同一工作時數的就業者，故予以標準化為「等就業者」，其標準化的過程如下：

- 1.依人力資源調查計算各業全日工作者之平均工時 (NH)。
- 2.依人力資源調查分別計算各從業身分別之平均工時，自營作業者 (AH_1)，雇主 (AH_2)，受僱者 (AH_3)，無酬家屬工作者 (AH_4)。
- 3.求各從業身分別等就業者之比例，即 $R_i = \frac{AH_i}{NH}$ ， $i = 1, 2, 3, 4$ 。
- 4.以 R_i 乘就業者人數 (E'_i) (受僱者採受僱員工資料)，即為各從業身分別之等就業者 (E_i)， $E'_i = R_i \times E_i$ 。
- 5.各業別等就業者 $E' = \sum_{i=1}^4 E'_i$

四、單位產出勞動成本

「單位產出勞動成本」主要在反映廠商勞動成本的變動，其衡量方法是以總薪資指數除以產出 (實質國內生產毛額) 指數而求得。即

$$\text{單位產出勞動成本指數} = \frac{\text{總薪資指數}}{\text{實質國內生產毛額指數}} \times 100$$

(以民國 95 年為基期，並按 95 年固定價格表示)

當單位產出勞動成本指數上升時，表示相同單位的產出需要支付較多的勞動成本，或廠商支付相同的成本，唯生產的產出卻減少。上式中的總薪資指數因雇主、自營作業者、無酬家屬工作者，並沒有薪資報酬，所以總薪資指數係以受僱員工之人數乘以其平均每人之薪資，再加上非受僱員工就業者 (包含雇主、自營作業者、無酬家屬工作者) 設算總薪資，然後再以民國 95 年為基期得到。

非受僱員工就業者總薪資設算公式如下：

$$\begin{aligned} \text{非受僱員工就業者設算總薪資} &= \frac{\text{非受僱員工就業者平均工時}}{\text{受僱員工平均工時}} \times \text{受僱員工每人平均薪資} \\ &\quad \times \text{非受僱員工就業者人數} \end{aligned}$$

而農業部門之平均每人薪資，則以下列方法重新估計：

1. 調整前農業平均薪資 $\times \frac{\text{受僱員工非農業平均薪資(5月)}}{\text{勞動力非農業平均薪資(5月)}} = \text{調整後農業平均薪資} (M_t)$ 。
2. 基期 (95 年 5 月) 農業平均薪資 $M_t = \frac{M_{t-1} + M_t + M_{t+1}}{3}$ 。
3. 各月農業平均薪資 $M_i = \text{基期農業平均薪資} M_t \times \text{農業僱工工資指數}$ 。

※其中勞動力非農業與農業之平均薪資係得自行政院主計總處之「人力運用調查報告」。

※而農業僱工工資指數則係得自行政院農業委員會之「農業統計月報」。

Compilation Method

I. Theoretical Base

Productivity can be measured in two ways--i.e. in terms of "average productivity" and "marginal productivity". In practice, the marginal productivity is still at the stage of theoretical discussion only. The present labor productivity statistics, are all calculated by dividing "total input" into "total output."

For labor productivity derived from production value-added, the part of output refers to the real gross domestic product (GDP) obtained from the national income production account (NIPA) while the part of input is computed on the basis of the number of persons and working hours of employees, employers, own-account workers, and unpaid family workers, with data obtained from establishment and household surveys. The calculation formulas are as follows:

(1) Labor Productivity Index =

$$\frac{\text{Real Gross Domestic Product Index}}{\text{Labor Input Index (man-hour} \bullet \text{number of employed} \bullet \text{number of equi-employed)}} \times 100$$

(The base year of the indexes is 2006 and GDP is measured at 2006 constant prices.)

(2) Labor Productivity =

$$\frac{\text{Real Gross Domestic Product}}{\text{Labor Input (man-hour} \bullet \text{number of employed} \bullet \text{number of equi-employed)}}$$

(GDP is measured at 2006 constant prices.)

II. Output

It does not make sense unless productivity is measured in real output--i.e. output in terms of constant prices. The labor productivity index computed from production value should have been based on the real gross national product (GDP) derived from the NIPA. However, it is impossible to find counterpart items of input for many components of the gross national product or the change in input match the change in output in proportion, such as net factor income from abroad, housing services, government services, errors and omissions. Consequently, they are not included in the output for calculating productivity.

1. Net Factor Income from Abroad

This item refers to the factor income earned from foreign countries deducted by factor expenditure paid foreign countries. This item of output has no counterpart item of labor input shown in the establishment and household surveys. Because of no counterpart item of labor input, this item should be excluded from the output in order to accurately demonstrate the change in productivity.

2. Housing Services

This item refers to the rent for a house which is either leased or used by the owner himself. This item of output also has no counterpart item of labor input and is, accordingly, excluded from the scope of output.

3. Government Services

This item refers to the amount of money paid for personal included in the settlement statement of all government agencies (including the sector in charge of national defense.) This item of output is measured according to the change in working hours of government employees and the output is denominated in fixed prices. Under the condition, the change in productivity is fixed and thus becomes meaningless. Consequently, this item should be excluded.

4. Errors and Omissions

(1)The item of “imputed bank service charge” refers to the interests earned by banks deducted by interests paid by these banks. The imputed bank interests represent an intermediate consumption made by all industries and thus should have been deducted from the output of all of the industries. Technically, there is no appropriate method used to do the deduction at present and for every industry, the imputed interests are not excluded from its output. They are thus excluded from the aggregate output of all of the industries.

(2) The item of “import duties” comprises customs duties, harbour construction dues and import commodity duties. Because of some revision in the System of National Accounts (SNA), this item is no longer included in the output of every industry. Nowadays, there is no appropriate method used to include, the import duties is excluded from the output of every industry.

III. Labor Input

1. Man-hour

Generally, the change in working hours is a better input to show the movement of productivity than the change in the employment population. The working hours should refer to the time used to do a job, rather than just the working time with pay. Because the gross domestic product is used as the output data, the labor input should be the working hours dedicated by the employment population (including not only man-hours of employees but man-hours of employers, own-account workers, and unpaid family workers.) Results produced in this way will then be able to meet the needs required in the analysis on productivity.

Currently, the DGBAS has data on employment population and working hours obtained from household surveys. However, statistics on working hours of employees obtained from establishment surveys should be able to more accurately reflect the movement of productivity. Consequently, labor in this case includes non-agricultural employee, employers, own-account workers, and unpaid family workers obtained from Manpower Survey. The labor input, with adjusted working hours obtained from Employees’ Earnings Survey, is calculated on the basis of the following formulas:

(1)Prior adjusted working hours of non-agricultural employment population in labor force (including employers, employees, unpaid family workers, and own-account workers) x

Working hours of employees

Working hours of employees in labor force

=adjusted working hours of non-agricultural employment population (including employers, employees, unpaid family workers, and own-account workers)

(2) Prior adjusted weekly working hours of agricultural employment population (including employers, employees, unpaid family workers, and own-account workers)/7 × The number of days of the current month

=Adjusted monthly working hours of agricultural employment population (including employers, employee, unpaid family workers, and own-account workers)

2. Employed Persons

In view of the fact that some countries are still using a much simpler indicator of “output per worker in the employment population” to measure the movement of labor productivity, this report also present the “output per worker in the employment population” for readers to use in their own applications and make the international comparison in this respect possible. (The employment population include employees, employers, own-account workers, and unpaid family workers obtained from household surveys).

3. Equi-employed Persons

In order to transfer the employed persons of different working hours into the standard employment, the so-called “equi-employed persons” , we must proceed some standardization for the employed persons. The standardized steps are as follows:

(1) Compute full-time worker's average working hour (NH) from Manpower Survey.

(2) Compute the average working hours of the different classes of employment from Manpower Survey, ex. Own-account workers (AH_1), Employers (AH_2), Employees (AH_3), Unpaid family workers (AH_4).

(3) Compute the ratio of the different classes of the equi-employed persons, i.e. $R_i = \frac{AH_i}{NH}$, $i = 1, 2, 3, 4$

(4) Using the ratio R_i multiply the different classed of employed persons respectively (E'_i), (the employee come from the Employees' Earnings Survey), that is the number of the different classes of the equi-employed persons. $E'_i = R_i \times E_i$

(5) The number of equi-employed persons for each industry is E' , $E' = \sum_{i=1}^4 E'_i$

IV. Unit Labor Costs

The “unit labor costs” are mainly designed to indicate the movement of production costs of business firms. It is calculated by dividing the output (real GDP) index into the total wage index. The formula is shown as follows:

$$\text{Unit Labor Costs Index} = \frac{\text{Total Wage Index}}{\text{Real GDP Index}} \times 100$$

(The base year of the indexes is 2006 and the real value is measured at 2006 constant prices.)

An increase in the unit labor costs index indicates that more labor costs should be paid to

produce a unit of output, or that the same amount of labor costs can produce less output. As employers, own-account workers, and unpaid family workers do not receive wages, the total wage index in the above formula, given the base year of 2006, is derived from multiplying the average wage per person by the number of employees, and adding total imputed wage of employment of non-employees (including employers, own-account workers, unpaid family workers),

Total wage of employment of non-employees is computed by the following method:

Total imputed wage of employment of non-employees

$$= \frac{\text{Average working hours of employment of non-employees}}{\text{Average working hours of employees}}$$

× Average wage per employees × Number of employment of non-employees

The wage per worker in the agricultural sector is re-estimated by the following method:

1. Prior adjusted average agricultural wage ×

$$\frac{\text{Average wage per non-agricultural worker (in May)}}{\text{Average wage per non-agricultural worker in labor force (in May)}}$$

= Adjusted average agricultural wage (M_t)

2. Average agricultural wage for base period (May of 2006)

$$M_t = \frac{M_{t-1} + M_t + M_{t+1}}{3}$$

3. Average monthly agricultural wage (M_i) =

Average agricultural wage for the base period M_t × agricultural wage index for employees

** The source of agricultural and non-agricultural average wages in the labor force is “Report on the Manpower Utilization Survey” published by the Directorate-General of Budget, Accounting and Statistics.

** The source of agricultural wage index of the employees is “Agricultural Statistics Monthly Bulletin” published by the Council of Agriculture, Executive Yuan.
